                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a human secretory protein from clone II.2. The secretory protein is designated TIGR (Trabecular Meshwork Induced Glucocorticoid Response) protein. The protein is highly induced by glucocorticoids in the endothelial lining cells of the human trabecular meshwork. The TICR polynucleotides and proteins can be used as markers for the diagnosis of glaucoma, primary open angle glaucoma (POAG), pigmentary glaucoma, and low tension glaucoma and their related diseases. They can also be used to diagnose or protect an individual's sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated glaucoma-associated nucleic acids - which encode Trabecular
Meshwork Induced Glucocorticoid Response protein, used to develop
products for diagnosing glaucoma-related diseases.
glucocorticoid response (TIGR) protein. The TIGR protein is a secretory protein specifically bound by the antibody of the invention. The antibody, especially in labelled form, can be used in the diagnosis of glaucoma by detecting elevated levels of the protein in the trabecular meshwork of the eye. Using the antibody, glaucoma is detected more

The method comprises amplifying a GLCIA gene with a primer pair selected from the sequences shown in AAZ37981-Z38008. The primers are used to determine whether a subject has or has the potential to develop primary open wide angle glaucoma. The present sequence represents the human GLCIA polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determination of a predisposition to glaucoma by analysing mutations in

The present sequence is human trabecular meshwork induced glucocorticoid response (TIGR) protein from clone II.2. TIGR gene is mapped to p36 of of hormosome 1 and to p13, q15 of chromosome 10, 11 or 12. The trabecular network has been proposed to play an important role in the normal flow of the aqueous and has been presumed to be the major site of outflow resistance in glaucomatous eyes. TIGR is highly induced by glucocorticoids in the endothelial lining of the human trabecular meshwork and so it is useful in diagnosing glaucomas, as well as disorders e.g. cardiovascular and immunological diseases related to expression of TIGR. IIGR is also useful in diagnosis or prediction of an individual's sensitivity to elevated intraocular pressure on
Novel fusion protein, useful in glaucoma diagnosis, comprises part of a
Trabecular Meshwork Induced Glucocorticoid Response (TIGR) protein and

The present invention relates to the isolation of 9 novel human PRO
20 polypeptides and the CDNA sequences (AAS15360-AAS15368) encoding them.
21 The novel PRO polypeptides include PRO1356, PRO1268, PRO1844,
22 PRO1351, PRO4322, PRO9964, PRO1008 and PRO19598. The CDNA sequences
23 Encoding these PRO polypeptides have been designated as clones DNA64886-
24 Encoding these PRO polypeptides and mestignated as clones DNA64886-
25 Encoding these PRO polypeptides and mestignated as clones DNA64886-
26 Encoding these PRO polypeptides and methods of using these
27 Encoding these PRO polypeptides and methods of using these
28 Encoding these PRO polypeptides and methods of inflammer leaded
29 Encoding are useful in the treatment and diagnosis of immune-related
20 Encoding are useful in the treatment and diagnosis of immune-related
21 Encoding are useful in the treatment and diagnosis of immune-related
22 Encoding these mellitus), infectious disorders (e.g. granulomatous hepatitis), immune-related renal diseases (e.g. cirrhosis),
22 Encoding arthitis), immune-related renal diseases (e.g. cirrhosis),
23 Encoding arthitis), immune-mediated stand diseases (e.g. contact
24 Encoding arthitis), immune-mediated stand diseases. The
25 Polymucleotide sequences of the invention may be used in gene therapy.
26 Encoding the present the novel human PRO polypeptides of the

The invention relates to CDNA (AAC87528, AAC87529) encoding human TIGR (trabecular meshwork induced glucocorticoid response) protein (AAB48845). The invention also relates to a transgenic cell or progeny thereof comprising a human TIGR protein nucleic aid of the invention. TIGR comprising a plucocorticoids. It is thought that TIGR protein is deposited in the extracellular spaces of the trabecular meshwork and binds to the surface of endothelial cells of the trabecular meshwork. This interferes with the normal outfilw of aqueous humour from the eye, leading to an increase in intraccular pressure and resulting in glaucoma. Human TIGR protein cDNA is useful for diagnosing glaucoma and associated disorders and its use provides for an improved and more accurate diagnosis of this condition. TIGR protein cDNA may also be used in the diagnosis of this diseases and conditions which are associated with altered expression or allowance the new orders and encounter the new orders and encountered expression or allowanced the new orders and encountered expression or allowanced the new orders the new orders and encountered expression or allowanced the new orders the new orders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human trabecular meshwork-induced glucocorticoid response (TIGR) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; zsig58; gonadal development; pregnancy; pubertal change; menopause; ovarian cancer; fertility; ovarian function; pancreas; polycystic ovarian syndrome; diabetes; eye disease; pituitary function; osteoporosis; bone disease, wound healing; bacterial infection; viral infection; fungal infection; analgesic; antidiabetic; vulnerary; gynaecological; osteopathic; cytostatic; ophthalmological; trabecular meshwork-induced glucocorticoid response; TIGR.
                                                                                                                                                                                                                                                              Novel nucleic acid encoding trabecular meshwork induced glucocorticoid response protein, useful for diagnosing glaucoma, cardiovascular and immunological disorders.

diagnosing or treating disorders associated with gonadal development, programory, pubertal changes, menopause, ovarian cancer, fertility, ovarian function, polycystic ovarian syndrome, pancreas, diabetes, eye disease, pituitary function, osteoporosis and other bone disease. The zig58 polypeptide may also be used in promoting wound healing, in anti-microbial applications, as a cell culture reagent in in vitro studies of exogenous microorganism infections (e.g. bone pain), in identifying cells, infection), as an analgesic (e.g. bone pain), in identifying cells, tissues or cell lines that respond to a zsig58-stimulated pathway, in antibodies. The antibody may be used for tagging cells that express zig58, for isolating zsig58 and for other diagnostic and therapeutic applications. The polymucleotide is also usedful in identifying a region of the genome associated with human disease states. This sequence the genome associated with human disease states. This sequence represents the human trabecular meshwork-induced glucocorticoid response (TIGR) protein, which is related to the human zsig58 polypeptide
                                                                                                                                                                                                                    New pancreatic and ovarian zsig58 polypeptides useful for diagnosing or treating disorders associated with gonadal development, pregnancy, pubertal changes, menopause, ovarian cancer, fertility, and ovarian or
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated pancreatic and ovarian zsig58 polypeptide and the polypucleotide encoding it. The polypeptide, polynucleotide and an antibody to the polypeptide are useful in
                                                                                                                                                                                                                                                                                                                                         Disclosure; Fig 1; 49pp; English.

Trabecular meshwork inducible glucocorticoid responsive protein; TIGR; myocilin; MYOC; human; glaucoma; cardiovascular disease; retinal degenerative disease; diagnosis; genetic profiling; ophthalmological; cardiovascular-gen. WO2002102300-A2 Homo sapiens 27-DEC-2002. 

22-NOV-2000; 2000US-0252420P. 05-APR-2001; 2001US-0281422P. 23-JUL-2001; 2001US-0306889P. 01-NOV-2001; 2001WO-US045645.

The present sequence is the protein sequence of human trabecular meshwork inducible glucocorticoid responsive protein (TIGR), also known as inducible glucocorticoid responsive protein (TIGR), also known as myocilin (MYOC). The invention is based on the finding that in addition to full-length MYOC mRNA, shorter mRNAs of the TIGR gene are expressed in to full-length MYOC mRNA, shorter mRNAs are differentially expressed in normal and glaucoma subjects. A claimed method of determining whether a subject has, or is at risk of developing, glaucoma, retinal degenerative or cardiovascular disease comprises generating a transcriptional profile (i.e. a fingerprint) in the subject or in a sample obtained from the subject based on the comprises generating a transcriptional profile (i.e. a fingerprint) in the subject has or is at risk of developing these diseases. Claims are also included for methods of establishing a MYOC genetic population of that the subject has or is at risk of developing these diseases. Claims are also included for methods of establishing alucoma, retinal degenerative or cardiovascular disease, and for pharmacogenomically consecution of individual having glaucoma, retinal degenerative or cardiovascular disease. Fingerprinting techniques for the confluence or mathorator or is likely to develop, a glaucoma, retinal degenerative or cardiovascular disease comprises a probe comprising about 10 consecutive amino acid residues or more from the corpus present sequence or naturally occurring mutants of it Determining whether a subject has or is at risk of developing glaucoma, retinal degenerative or cardiovascular disease by generating a transcriptional profile in the subject, based on the expression of Claim 36; Fig 3; 52pp; English. myocilin.

                                                                                                                                                                                                                                                               ö
                                                                                             diagnosing or treating subjects at risk for or having eye disease, e.g.
Primary Open-Angle Glaucoma, ocular hypertension, or elevated intraocular
                                                                                                                                                 The invention describes a new composition, which comprises an isolated Latrophilin (LPH) nucleic acid. The compositions are useful for diagnoshing or treating subjects at risk for or having eye disease, e.g. Primary Open-Angle Glaucoma (e.g. juvenile onset or adult onset), ocular hypertension, or elevated intraocular pressure. This is the amino acid sequence of human TIGR/myocilin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                               Gaps
                                                                                  Latrophilin (LPH) polynucleotides and polypeptides, useful for

multiple sclerosis, systemic lowes exthematosus and human immuno-
deficiency virus (HIV) infections), hyperproliferative disorders (e.g.
ancers and Gaucher's disease), cardiovascular diseases (e.g. Scimitar
syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis),
angiogenic disorders (e.g. corneal graft neovascularisation and diabetic
retinopathy), neurological disorders (e.g. Huntington's chorea,
Alzheimer's disease and Parkinson's disease), infectious diseases and/or
for promoting wound healing, regeneration and/or chemotaxis. The nucleic
acid molecules may be used to produce the secreted polypeptides. They may
the presence of similar nucleic assays to detect and quantitate
the presence of similar nucleic acid sequences in samples. The
polypeptides may be used as antigens in the production of antibodies and
in assays to identify modulators of their expression and activity
                    present sequence is one of 32 novel human secreted polypeptides. The
                               nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to albumin fusion proteins comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; haqgestive disorder; immune disorder; endocrine disorder; haematopoletic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunomodulator; anti-HIV; antidiabetic; haemostatic; nootropic; neuroporetective; antibarkinsonian; antimicrobial; neuroleptic; osteopathic; antiarthritic.

         albumin, HSA). The process are useful for treating a disease or disorder that may be modulated by therapeutic procein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immunodisorders (e.g. acquired immunodeficiency syndrome, AlDS), endocrine disorders (e.g. diabetes), haemacopoietic disorders, neural disorders (e.g. Alzheimer's). Parkinson's, Creutzfeldt-Jacob disease, encephalomyellitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel enterchaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polymucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Exterchaemorragic B coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.

```
The invention relates to an isolated nucleic acid detection reagent expable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reaction (FCR) primers, oligomers, and for chromosome and gene mapping, reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymciase chain reaction in the production of (II). The polymciase chain and in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polympeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymcleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention provides novel DNA sequences encoding enzymes such as plant thioredoxin-porphobilinogen synthase (T-PPS) and plant porphobilinogen synthase (T-PPS) and plant porphobilinogen synthase (PPS). Methods of determining the enzymatic activity of T-PPS or PPS or its functional fragment are provided that involves contacting measuring the amount of porphobilinogen formed from it. Compounds which can modify the enzymatic activity T-PPS or PPS can also be identified similarly, which are useful for inhibiting plant growth by inhibiting enzymatic activity of T-PPS or PPS or pps can also be indentified enzymatic activity of T-PPS or pps or its functional fragment. The compounds thus identified are useful as herbicides. The present sequence represents the fusion protein T-PPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thioredoxin, porphobilinogen synthase, T-PPS, PPS, enzyme, herbicide, delta-aminolevulinic acid, plant growth inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel plant thioredoxin-porphobilinogen synthase or porphobilinogen synthase polypeptides, useful for identifying compounds for use as herbicides by inhibiting enzymatic activity of the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                      -ND5-01
                                                                                                                                                                                                                                                                                                                           -NUL-80
     The invention provides novel DNA sequences encoding enzymes such as plant thioredoxin-porphobilinogen synthase (T-PPS) and plant porphobilinogen synthase (T-PPS) and plant porphobilinogen PPS or the factorial part of determining the enzymatic activity of T-PPS or PPS or its functional fragment are provided that involves contacting measuring the amount of porphobilinogen formed from it. Compounds which can modify the enzymatic activity T-PPS or PPS can also be identified enzymatic activity of T-PPS or PPS or PPS can also be identified enzymatic activity of T-PPS or IPS or PPS or plant growth by inhibiting compounds thus identified are useful as herbicides. The present sequence represents the fusion protein T-PPS
                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The present invention describes new human secreted proteins which were isolated from adult placenta, adult retina, foetal brain, foetal kidney, adult blood, adult brain, adult thyroid, adult bladder, adult neural tissue, adult testes, and adult lymph node cDNA libraries. The human secreted proteins, and the polymucleotides encoding them, are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include mutritional activity, cotokine and correctives or suppressing activity, hemmatopoiesis regulating (e.g. as vaccines) or suppressing activity, hemmatopoiesis regulating activity, tissue growth activity, activin/inhibin activity, cadherin/tumour consequence of receptor/ligand activity, and tumour inhibition activity. The polymucleotides are also stated to be useful for gene therapy. AA23316 to AA23373 encode human secreted proteins, and AAY52998 to AAY53060 represent human secreted proteins, given in the present invention

The invention relates to a novel pharmaceutical composition comprising a nucleic acid molecule or polypeptide which is a human homologue of a brosophila melangaster polypeptide or polymuclectide. The composition of the invention may be utilised during the diagnosis, study, prevention and treatment of diseases related to body-weight regulation and thermogenesis including metabolic disorders such as obeatty, Syndrome x and insulineresistance syndrome and eating disorders e.g. cachexia, diabetes mellitus, hypertension, pancreatic dysfunctions, arteriosclerosis, coronary heart disease, hypercholesterolaemia, dyslipidaemia, osteonary heart disease, Phypercholesterolaemia, dyslipidaemia, osteoarthritis and gallstones. Furthermore, disorders related to reactive oxygen species (ROS) defence may be addressed by the invention including neurodegenerative disorders or mitochondrial disorders. Finally, the

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL101840-ABL10117) expressed DNA sequences (ABL101840-ABL10175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
composition of the invention may be useful in gene therapy. The current sequence is that of the human optic atrophy 1 (OPA1) protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to proline-rich extensin-like receptor kinase (PBRK). The PERK nucleic acids and polypeptides are useful for increasing the resistance of plants to wounding and pathogens. These are also useful for producing transgenic plants with increased wounding and pathogen resistance compared with a wild type plant, as well as in assays for identifying and developing compounds to inhibit and/or enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New proline-rich, extensin-like receptor kinase nucleic acids and polypeptides useful for increasing plant wounding or pathogen resistance, or for producing transgenic plants with increased wounding or pathogen
                                                                                                                                                     Proline-rich extensin-like receptor kinase; PRRK; resistance; plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PERKI; transgenic; plant; proline-rich extensin-like receptor kinase; wound; pathogen resistance; plant growth; seed production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The invention relates to producing a transgenic plant having increased plant height, number of branches, number of seed pods and/or seed production compared to a non-transgenic plant, and/or guitcker flowering or later sensecence compared to a non-transgenic plant. The method Extensin-like Receptor Kinase (PEKF) nucleic acid molecule or a mucleic acid molecule having PEKR activity. The method, as well as the PEKR nucleic acid molecule and polypeptide, are useful in increasing plant resistance to wounding and pathogens and in increasing plant growth and seed production. The mucleic acid molecule and polypeptide may also be used in producing transgenic plants or transgenic host cells. The present sequence represents a PERKI polypeptide related protein from A. thaliana
                                                                                                                                                                                                                                                                                                                                                        Producing a transgenic plant having an increased plant resistance, plant growth or seed production comprises transforming a plant with a nucleic acid molecule having a Proline-rich Extensin-like Receptor Kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed correct corrections. (II) is useful in gene therapy techniques to restore normal cutvity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a supplement. (II) and its binding partners are useful in medical imaging copypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging (II). (I) and (II) are useful in medical imaging copypaptide and polynucleotide sequences have applications in the prince of the sequence of muscations conditions in the produce other types of data and products dependent on DNA and and and to produce other types of data and products dependent on DNA and mino acid sequences. Abgonolo-Abgo3037 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the printed patences.
                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purine/pyrimidine triphosphate type nucleotidyltransferase #156.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleotidylyltransferase, enzyme, active site engineering, alpha-D-glucopyranosyl phosphate thymidylyltransferase, Ep, substrate specificity, nucleotide sugar, glycosylated bioactive natural product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 4; Length 760;

The invention relates to a Nucleotidylyltransferase mutated at one or more amino acids selected from V173, G147, W224, N112, G175, D111, E162, T201, 1200, E199, E195, E897, L109, Y146 or Y177 (with reference to the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate the Salmonella enterica rmlA-encoded alpha-D-glucopyranosyl phosphate altering nucleotidylyltransferase substrate specificity of the enzymes. The mutants and methods altering nucleotidylyltransferase substrate specificity. The nucleotidylyltransferase exhibits different substrate specificity for GTP, CTP, TTP, UTP and ATP than a non-mutated mucleotidylyltransferase. The mutant may also exhibit a high degree of sequence identity to Salmonella enterica LT2 alpha-D-glucopyranosyl phosphate thymidylyltransferase (Ep) and can convert a wide variety of phosphates. The mutants can be exploited in the biosynthesis of glycosylated bloactive natural products of pharmacological use. The present sequence identity to Salmonella enterica LT2 alpha-D-glucopyranosyl phosphate of sequence identity to Salmonella enterica LT2 alpha-D-glucopyranosyl phosphate the specification but was obtained from Genbank
                                                                                                                         Nucleotidylyltransferase mutated at one or more amino acids, useful in the synthesis of nucleotide sugars.
                                                                                                                                                                                                    Claim 3; Page; 182pp; English.

```
The invention relates to secreted and membrane-associated polypeptides and polymucleotides. The sequences of the invention are useful in cliagoratic assays for detecting diseases associated with inappropriate activity or levels of these polymucleotides, and in identifying their sequences of the invention are useful in therapy. The sequences of the invention are useful in therapy. The immunological response. The sequences of the invention are useful for cliamunological response. The sequences of the invention are useful for inflammation, congenital muscrolar disorders, haematopoietic clisorders, wound healing disorders, cholesteryl ester storage disease, inflammation, congenital muscrolar dystrophy, junctional epidermolysis bullosa, parkinson's disease, Huntington's chorea, multiple sclerobis, bullosa, parkinson's disease, Huntington's chorea, multiple sclerobis, alteraphrenia, sbg42445pRoa-associated disorders, collection, cliftammatory bowel disease, asthma, arthritis, cliftamia, psoriasis, inflammatory bowel disease, asthma, arthritis, cliftamia, psoriasis, inflammatory bowel disease, atherosclerosis, spridcome, restenosis, brain injury, AIDS, bone diseases, atherosclerosis, diseases including paraeupranuclear palsy, myotonic dystrophy, depression, anxiety disorders and aleep disorders, cardiovascular crespiratory disease, including congestive heart failure and myocardial infarction, crespiratory diseases including congestive heart failure and myocardial infarction, crespiratory diseases including characterial constructive pulmonary disease, including paraeupranicle obstructive pulmonary disease, including dypercholesterolaemia, hypertriglyceridaemia, cirrhosis, viral cliftuding acute and chronic renal failure, glomentulonaphritis, proper including disease including acute and chronic renal failure, including acute and chronic renal failure, including acute and chronic renal failure including acute and chronic renal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       syndrome, cystinuria, skeletal muscle disorders including hypoglycaemia and tendinitis, gastrointestinal diseases including intestinal obstruction and tropical sprue, spleen disorders including hypersplenism, Hodgkin's disease and malignant lymphoma, testicular cancer, male reproductive diseases including low testosterone and male infertility.
                                                                                                                                                                                                                                                                                          Novel secreted and membrane-associated polypeptides and polynucleotides useful for preventing, ameliorating or correcting dysfunction or disease including diabetes, cancer, hypertension and growth abnormalities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to isolated human carboxypeptidase, scramblase and protocadherin protein. The nucleic acids encoding the polypeptides are designated as 23566, 33489 and 57779 respectively. Examples of the conditions related to aberrant activity or expression of the invention include, inflammatory disorders such as diabetes mellitus, arthritis, conditions erythematosus; neurological disorders acid as athariance, gisedematic lupus erythematosus; neurological disorders (e.g. disease, Parkinson's disease; cardiovascular disorders (e.g. the heart and/or blood vessels) such as atherosclerosis, arthythmia, conditionation blood vessels include endothelial cell disorders e.g. thrombocytopaenia; or cellular proliferation or differentiation disorders controlling assays in competition blood clotting disorders e.g. thrombocytopaenias, blood vessel related disorders e.g. hypertension and disorders involving red blood cells e.g. anammia; and viral diseases e.g. hepatitis but invention is useful for producing antibodies, in drug correening assays, in competition binding assays to discover compounds that interact with the protein, in pharmacogenomic analysis and for monitoring therapeutic effects during clinical trials and treatment. The antibody is useful to assess abnormal tissue distribution or abnormal expression during development, to identify protein turnover, to assess correnal and aberrant subcellular localisation of cells in various tissues of that macogenomic analysis, for tissue typing, forensic identification, in pharmacogenomic analysis, for tissue typing, forensic identification, in the chromosomal positions of the polymucleotides, for expressing antigenic paptides, for expressing antigenic paptides, for designing ribozymes, constructing host cells, transgenic animals. The
                                                                                                                                                                                                                           polynucleotides for identifying modulators for use in diagnosing,
treating diabetes mellitus, atherosclerosis, cancer, Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               depression; cardiovascular disease; myocardial infarction; renal failure; respiratory disease; liver disorder; Fanconi's syndrome; spleen disorder; type II diabetes mellitus; skeletal muscle disorder; immunosupressive; hypersplenism; renal disease; hypoglycaemia; gastrointestinal disease; nootropic; cirrhosis; Hodgkin's disease; neuroleptic; antiinflammatory;

and polymucheotides. The sequenced and membrane associated with inappropriate diagnostic assays for detecting diseases associated with inappropriate activity or levels of these polymucheotides, and in identifying their activity or levels of these polymucheotides, and in identifying their agonists and antagonists that are potentially useful in therapy. The sequences of the invention are useful in therapy. The immunological response. The sequences of the invention are useful for treating cancers, infections, autoimmune disorders, haematopoietic disorders, wound healing disorders, cholesteryl ester storage disease, inflammation, congenical muscular dystrophy, junctional epidermolysis bullosa, Parkinson's disease, Holican's chorea, multiple sclerosis, viral and bacterial infections, Alzheimer's disease, asthma, arthritis, septicaemia, psoriasis, inflammation, bowel disease, transplant rejection, graft verse host disease, isohaemia, stroke, acute respiratory disease septicaemia, psoriasis, inflammation, bowel diseases, tatasplant rejection, depression, anxiety disorders and sleep disorders, cardiovascular respiratory diseases including parasupranuclear pallsy, myotonic dystrophy, diseases including parasupranuclear pallsy, myotonic dystrophy, diseases including parasupranuclear pallsy, myotonic dystrophy, diseases including congestive heart failure and myocadial infarction, respiratory disease including congestive heart failure and myocadial infarction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         respiratory diseases including chronic obstructive pulmonary disease, acute bronchits and adult respiratory distress syndrome, liver disorders including hypercholesterolaemia, hypertriglyceridaemia, cirrhosis, viral and non-viral hepatitis, type II diables mellitus, renal disease including acute and chronic renal failure, glomerulonephritis, Fanconi's syndrome, cystimuria, skeletal muscle disorders including hypoglycaemia and tendinitis, gastronitestinal diseases including intestinal obstruction and tropical sprue, spleen disorders including hypersplenism, Hodgkin's disease and malignant lymphoma, testicular cancer, male reproductive diseases including low testosterone and male infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel secreted and membrane-associated polypeptides and polymucleotides useful for preventing, ameliorating or correcting dysfunction or disease including diabetes, cancer, hypertension and growth abnormalities.
haemostatic, vulnerary, anticonvulsant, antirheumatic, neuroprotective, nephrotropic, hypotensive, vasotropic, cytostatic, cerebroprotective, allergy, protocadherin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to secreted and membrane-associated polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kabnic KS, Lai Y,

Martensen SA; Xie Q, Rizni SK;

the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense of nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits estimate a biological pathway required for proliferation, or that inhibits proliferation of an identifying a gene required for cellular proliferation of an identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound specific compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound specific compound that inhibits proliferation of an organism; or (13) identifying the target of a compound that inhibits the compound that inhibits the proliferation of an organism. The antisense nucleic acids required to relinkar proliferation of an organism. The antisense nucleic acids required to confidence or cellular proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids are useful for for discretions or screening for homologous molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present eqquence is encoded by the target prokaryotic essential genes. Note: The sequence data for this patent din ont form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences The invention relates to an isolated nucleic acid comprising any

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caection (PCR) primers, Oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed construction of (II). The polymucleotides are also used in activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a colypoptide in tissue, as molecular weight markers and as a food supplement. (III) and its binding partners are useful in medical imaging of supplement. (III) and its binding partners are useful for treating disorders cupulypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of diagnostics, for genefic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WHDD at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to an isolated nucleic acid molecule (a promoter of rice chemically induced cDNA (RCI-1), which encodes a lipoxygenase) capable of driving demaically-inducible but not wound- or pathogen-inducible expression of an associated nucleotide sequence. Also included are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the lipoxygenase gene, promoter fragments, the lipoxygenase transit peptide which directs expressed proteins to the plastid, a vector comprising the promoter or fragments are useful for expressing an uncleotide sequence of interest. The transit peptide is useful for targeting an associated protein of interest to plastids. A nucleic acid which expresses protein of interest to plastids. A nucleic acid which expresses protein of interest to plastids. A nucleic acid which expresses contoxins when transformed into a plant. The lipoxygenase is useful for inhibiting fungal mycotoxins. The promoter is useful for regulating transcription of a chemically inducible but not wound or pathogen transcription of a chemically inducible but not wound or pathogen inducible gene, which involves applying a chemical pregulating a resolution or seed containing a chemically regulatable nucleotide sequence.

Transgenic plants as described above are useful for breeding improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            promoter of

ö
plant lines that for example increase the effectiveness of conventional methods such as herbicide or pesticide treatment or allow to dispense with the methods due to their modified genetic properties. New crops with improved stress tolerance can be obtained that, due to their optimised genetic equipment yield harvested product of better quality than products that were not able to tolerate comparable adverse developmental conditions. The present sequence represents rice liboxygenase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an isoform of a human mitochondrial polypeptide designated MSP1. MSP1 belongs to the dynamin family, and is a Grase which is implicated in mitochondrial function and cell division. MSP1 mutants are associated with dominant optical atrophy 1 (OPA1). Seven isoforms of human MSP1 also exist. MSP1, and its isoforms, are used to screen for specific modulators, potentially useful for treating disorders of mitochondrial function and cell division, especially neurodegenerative diseases, particularly optical neuropathy and specifically OPA1. MSP1 and its isoforms may also be used for development of antiproliferative treatments, e.g. for cancer. Vectors that contain the nucleic acid encoding MSP1 are useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human mitochondrial polypeptide MSP1 and its isoforms, useful for identifying agents for treating neurodegeneration, also related nucleic

The CDNA encoding these proteins were isolated using the primers given in AAQ50993-94 which were derived from a strongly conserved peptide region within the glutamate receptor subunit transmembrane domain III. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents an isoform of a human mitochondrial polypeptide designated MNSP1. MSP1 belongs to the dynamin family, and is a GTPase which is implicated in mitochondrial function and cell division. MSP1 mutants are associated with dominant optical atrophy 1 (OPA1). Seven isoforms of human MSP1 also exist. MSP1, and its isoforms, are used to screen for specific modulators, potentially useful for treating disorders of mitochondrial function and cell division, especially neurodegenerative diseases, particularly optical neuropathy and specifically OPA1. MSP1 and its isoforms may also be used for development of antiproliferative treatments, e.g. for cancer. Vectors that contain the nucleic acid encoding MSP1 are useful for gene therapy
                                                                                                                                                                     New human mitochondrial polypeptide MSP1 and its isoforms, useful for identifying agents for treating neurodegeneration, also related nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents an isoform of a human mitochondrial polypeptide designated WSPL MSPL belongs to the dynamin family, and is a GTPase which is implicated in mitochondrial function and cell division. MSPL mutants are associated with dominant optical atrophy 1 (OPAL) seven isoforms of human MSPL also exist. MSPL, and its isoforms, are used to screen for specific modulators, potentially useful for treating disorders of mitochondrial function and cell division, especially neurodegenerative diseases, particularly optical neuropathy and specifically OPAL MSPL and its isoforms may also be used for development of antiproliferative treatments, e.g. for cancer. Vectors that contain the nucleic acid encoding MSPL are useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

The present sequence represents an isoform of a human mitochondrial polypeptide designated MSP1. MSP1 belongs to the dynamin family, and is a GTPsse which is implicated in mitochondrial function and cell division. MSP1 mutants are associated with dominant optical atrophy 1 (OPA1). Seven screen for specific modulators, potentially useful for treating disorders of mitochondrial function and cell division, especially neurodegenerative diseases, particularly optical neuropathy and specifically OPA1. MSP1 and tris isoforms may also be used for development of antiproliferative treatments, e.g. for cancer. Vectors that contain the mucleic acid encoding MSP1 are useful for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense
 identifying agents for treating neurodegeneration, also related nucleic

uniferration or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide, (5) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway required for proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological cora gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are useful for for cellular proliferation to isolate encledic acide required for for cellular proliferation to a candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                       drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp, wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in certain diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yeast, fungus; apoptosis; infection; proliferative disease; vaccine; autoimmune disease; ischaemia; neurodegeneration.

polypeptide that is encoded by a gene that is mutated in several Chediak-
Higashi syndrome (CHS) patients. LYST1 can be expressed in host cells
Higashi syndrome (CHS) patients. LYST1 can be expressed in host cells
using an isolated LYST1 gene for use in various pharmacological and
immunological applicatins. LYST1 products (see AAW33596-97) of long and
short isoforms of human LYST1 are also claimed. LYST1 regulates
degranulation of lysosomes, late endosomes and acidic secretory granules,
containing truncated LYST1 peptides may be used to treat
inflammatory and autoimmune diseases e.g. asthma, urticaria, inflammatory
contains systemic lugus erythematosus, rheumatorid arthritis,
psoriasis, systemic vasculitis, glomerulonephritis, multiple sclerosis
and post-angioplasty restenosis, while LYST1 peptides that minic or
augment LYST1 function may be used to treat neoplasia. (NB. the amino
correspond in the C-terminal region to the translated sequence of the
LYST1 gene provided (see AAT74198))
                                                                                                                                                                                                                                                                                                                                                                                            0;
                                This protein sequence comprises a lysosomal trafficking regulator (LYST1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glutamic acid receptor; synaptic signal translation; diagnosis; brain disease; nerve signal; gene therapy; NWDA; cerebellum; ICR; mouse;

preference for non-homologous recombination. The method comprises

cretering an integration pathway towards homologous recombination. The
method is useful for directing integration of a nucleic acid of interest

to a subtelomeric and/or telomeric region in an eukaryote with a

preference for non-homologous recombination. The nucleic acid of interest

comprises an inactive gene to replace an active gene, or vice versa, is a

comprises an inactive gene to replace an active gene, or vice versa,

comprises an inactive gene to replace an active gene, or vice versa,

comprises an inactive gene to replace an activities substance or a

substance conferring resistance for an antibiotic substance or a

cukaryotic cell, or encodes a therapeutic proteinaceous substance or a

substance conferring resistance for an antibiotic substance or a cell.

The method is useful for improving gene targeting efficiency. The method

is useful in the replacement of an active gene by an inactive gene, for

is useful in the replacement of an active gene by an inactive gene, for

c. g. for the inactivation of genes controlling undesired side branches of

metabolic pathways, to increase the production of specific secondary metabolites

c. to inhibit formation of unwanted metabolites, and also to inactive

genes controlling senescence in fruits and flowers or that determine

t. Hower pigments. The method is also useful for replacing an inactive gene

by an active gene. For e.g. the replacement of a defective p53 by an
                                                                                                                                                                                                                         ö
The sequence shows a glutamic acid receptor. The receptor is useful for the analysis of nerve signal translation; within the synapse, expresssion of synapse platicity, nerve cell necrosis, brain structure and brain disease. It can also be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for directing integration of a nucleic acid of interest to a pre-determined site, where the nucleic acid has homology at or around the pre-determined site, in a eukaryote with a

intact p53. Many tumours acquire a mutation in p53 during their development which renders it inactive and often correlates with a poor response to cancer therapy. By replacing the defect p53 by an intact p53, e.g. through gene therapy, conventional anti cancer therapy have better changes of succeeding. The method is also useful for therapeutic proteinaceous substance integration. A tumoricidal gene can be delivered to a pre-determined site present only in e.g. proliferating cells, or present only in tumour cells, e.g. to the site where a tumour antigen is expressed form. ABB77984-86 represent RAD50 homologues. RAD50 is involved

The invention describes an isolated human polypeptide (I), a naturally occurring amino acid sequence at least 90 % identical to the protein, or a biologically active fragment or an immunogenic fragment of the protein.

The protein modification and maintenance molecules are useful in the diagnosis, treatment, and prevention of gastrointestinal (e.g. dysphagia, esophagal spasm, gastritis, anorexia or nausea), cardiovascular (e.g. atheroselerosis, hypertension, vaculitis, aneutysms, or ischaemic heart disease), autoimmune/inflammatory (e.g. acquired immunodeficiency carborisis, altergies, ankylosing spondylitis, ansemia or amyloidosis), altergies, ankylosing spondylitis, ansemia or amyloidosis), cell proliferative (e.g. renal tubular acidosis, bursitis, or cirrhosis), developmental (e.g. renal tubular acidosis, canemia, bone resorption, or epilepsy), epithelial (e.g. altergic contact dermatitis, keratosis pilaris, insect bites, keloid, dermatofibroma or eczema), neurological (e.g. stroke, cerebral neoplasms, Alzheimer's disease, Huntington's disease or dementia), and reproductive disorders (e.g. infertility, endometriosis, gynecomastia or ectopic pregnancy).

These may also be used in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of protein modification and maintenance molecules polynucleotides are useful in somatic and germline gene therapy. This is the amino acid sequence of a protein modification and maintenance molecules described in the invention ö New protein modification and maintenance molecules useful for treating or preventing gastrointestinal, cardiovascular, autoimmune/inflammatory, cell proliferative, developmental, neurological and reproductive Gaps ö Length 1537; 0; Indels Query Match 2.1%; Score 7; DB 5; Ler Best Local Similarity 100.0%; Pred.                                                           This protein comprises the shorter isoform of murine lysosomal trafficking regulator Lystl, a protein that regulates degranulation of lysosomes, late endosomes and acidic secretory granules primarily in leukocytes. Its sequence was deduced from a Lystl cDNA clone (AAT74200) artificial chromsome. Alternative splicing also yields a longer isoform artificial chromsome. Alternative splicing also yields a longer isoform (see AAW23594) of Lystl. Homologous human sequences (see AAW35595 AAW23597) have been identified that are associated with Chediak-Higashi syndrome (CHS). Murine Lystl and human Lystl polypeptides (see AAW355939) and be expressed in recombinant host cells for use in raising antibodies, in vaccines and in the development of therapeutic approaches to treatment of autoimmune diseases and certain types of tumours. The existence of an animal model of CHS with a similar genetic lesion will assist efforts to develop novel therapies for this disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      secreted protein; immunomodulatory; antisclerotic; dermatological;

Nucleic acids encoding 32 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease

The present sequence is one of 32 novel human secreted polypeptides. The

Claim 11; Fig 4; 890pp; English.

and diabetic retinopathy.

```
nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immuno-deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases (e.g. Scimitar Syndrome, Chagas s cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples. The collypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of their expression and activity
                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New fusion protein for treating disease e.g. diabetes comprises an

that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention

New human protease - like proteins and polynucleotides encoding the proteins, useful e.g., in mapping a unique gene to a particular chromosome, in identifying mutations associated with a particular 

Claim 2; Page 38-42; 42pp; English.

The present invention relates to the isolation of a novel human protein (MHP), and the polymucleotide sequence encoding it. The NHP shares equence homology to proteases. The gene encoding the protease of the invention maps to chromosome 9. The polypeptide and polymucleotide sequences of the invention can be used for diagnosis, drug screening, clinical trial monitoring, treatment of biological or medical disorders, and cosmetic or nutriceutical applications. The polymucleotide sequence is useful in forensic biology, in identifying mutations associated with a particular disease, in assessing gene expression patterns, and in gene therapy. The polypeptide sequence can be used to generate antibodies which can be used as reagents in disapnostic or screening assays. The present sequence represents the human protease of the invention

CADECM proteins are useful for preparing a composition for diagnosing or treating a disease or condition associated with decreased expression or overexpression of functional CADECM e.g., immune disorders or cancer. The invention is also useful in gene therapy. The present sequence is human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition.

The invention relates to novel genes (ABV83682-ABV84101) and proteins (ABV86710-ABR67129) useful for preventing, treating or ameliorating medical conditions e.g. by protein egene therapy. The genes are isolated from a range of human tissues disclosed in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polypeptide useful for diagnosis, prognosis, prevention, and treatment of immune, hyperproliferative, renal, respiratory, cardiovascular, reproductive, endocrine, gastrointestinal and

The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, autoimmune bytoiditis, diabetes mellitus, Crohn's disease, cardiovascular disorders such as myocardial ischaemis; (d) wound healing if e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), in expressed DNA ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (2) comprising (I) or (II). (I) and (II) and polyclonal antisers or a monoclonal antibody raised to imfection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Purthermore, (I) (especially when they care rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the conformed by the complexity of the parasitic lifecycle, and concoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquitor essistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with a human disease, which includes a pathology associated with NoVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NoVX polypeptide or polymucleotide is useful for treating endocrine/

C metabolism-related diseases (e.g. obesity or disbetes), central nervous system disorders (e.g. plantiment or dispets), autoimmune system disorders (e.g. psoriasis, allergy, upus erythematosus, callengy, multiple sclerosis, schizophrenia or depression), autoimmune athma, inflammatory disorders (e.g. psoriasis, allergy, upus erythematosus, athma, inflammatory disease, rheumatoid arthritis or obserthitis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma, liver diseases (e.g. liver cirrhosis), lung diseases (emphysema or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic).

C These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic analysis of various human disorders, a novel human NOV protein

Human utrophin (AAW22017) is 395 kDa protein which shows strong sequence similarity to dystrophin and which may protect muscle from the consequences of dystrophin loss. It comprises an actin binding domain, rod domain and dystrophin potent complex (DPC) binding domain. A includes only the actin binding and DPC binding domains, but which retains utrophin polypeptide (AAW22016) has been produced which retains utrophin function. Its expression in an animal model significantly decreased the severity of the dystrophic muscle phenotype, indicating usefulness in the treatment of muscular dystrophy. Utrophin polypeptides can also be used to screen for substances that modulate utrophin binding to actin and/or the DPC
                                                                                                                                                                                                                                                                                                                                                                                                                                                    mouse; lysosomal trafficking regulator; Chediak-Higashi syndrome;

The present invention describes an immunogenic composition (I) comprising a CASB933 polymuclectide, polypeptide or its immunogenic fragment, or an antigen presenting cell modified to express the polypeptide, and a pharmaceutical carrier. (I) has cytostatic and immunosuppressive activities, and can be used in gene therapy and vaccines. The immunogenic composition is useful in medicine. The CASB933 polypeptides or its immunogenic fragments, or CASB933 polymuclectides encoding the polypeptides are useful for manufacturing an immunogenic composition for
                                                                                                                                                                                  Human; CASB933; immunogenic; cytostatic; immunosuppressive; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          properting or treating a patient suffering from or susceptible to preventing or treating a patient suffering from or susceptible to preneoplastic lesions of lung cancer or lung cancer, such as small cell lung carcinoma, e.g. squamous (epidermoid) carcinoma, non-small cell lung carcinoma, e.g. squamous (epidermoid) carcinoma, adenocarcinoma including bronchoalveolar or large cell (undifferentiated) carcinoma, carcinoids, bronchial gland tumours, or mesotheliomas. The CASB933 polymorlectides and polymeptides are also useful for diagnosing the presence of, or a susceptibility to, preneoplastic lesions of lung cancer or lung cancer in a subject, or for treating autoimmune diseases. The present sequence represents an immunogenic peptide fragment of human CASB933, which is given in the exemplification of the present invention
                                                                                                                                                                                                     vaccine; cytostatic; immunosuppressive; gene therapy; vaccine; medicine; preneoplastic lesion; lung cancer; small cell lung carcinoma; carcinoma; carcinoma; carcinoma; epidermoid; adenocarcinoma; bronchoalveclar carcinoma; large cell carcinoma; bronchial gland tumour; mesothelioma; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An immunogenic composition comprising a CASB933 polynucleotide, polypeptide or its immunogenic fragment, for preventing or treating a patient suffering from or susceptible to preneoplastic lesions of lung
                                                                                                                                        Human CASB933 immunogenic peptide fragment SEQ ID NO:17.

                                                                                                                                                                                                                                                                                                                                                                                                                                             27-FEB-2003.
```

This protein comprises the longer isoform of murine lysosomal trafficking regulator Lystl, a protein that regulates degranulation of lysosomes, late endosomes and acidic secretory granules primarily in leukocytes. Its sequence was deduced from a Lystl cDNA clone (AAT74199) that had been identified from a beige (bg) mutation critical region yeast artificial chromosome. Alternative splicing also yields a shorter isoform (see AAW23595) of Lystl. Homologous human sequences (see AAW23596 and AAW23597) have been identified that are associated with Chediak-Higashi syndrome (CHS). Murine Lystl and human LYSTl polypeptides (see AAW23593-98) can be expressed in recombinant host cells for use in raising autibodies, in vaccines and in the development of therapeutic approaches to treatment of autoimmune diseases and certain types of tumours. The

Mammalian lysosomal trafficking regulators LYST1, Lyst1, LYST2 and Lyst2

- useful to diagnose Chediak-Higashi syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, is useful for treating cancer. The polypeptide is also polypeptide, is useful for treating cancer. The polypeptide is also class II MHC-binding polypeptide. The polypeptides and polymedides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, myeloma or leukaemia. These are also useful for streating an expressed protein tag (EPT) isolated from human tissue for translational expresses protein tag (EPT) isolated from human tissue for translational specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

                                                                                                                                                                                                                                                                                        The present invention describes a number of peptides which disrupt the G2 cell cycle checkpoint when administered to a cell. They act by inhibiting Chk1 and Chk2 kinases, and may be derived from Cdc25C. The peptides, an example of which is shown here, are useful in the treatment of cell proliferation diseases, such as cancer, as the inhibition of the Chks allows DNA damage and induces apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosis of hemochromatosis, by detecting a specific deletion in the transferrin receptor-2 gene, or corresponding deletion from the encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; TFR2-alpha; diagnosis; haemochromatosis; transferrin receptor-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a composition comprising an isolated acetylcholine receptor (AChR) oligopeptide of about 12 to 20 amino acids. The peptides form a set of 69 overlapping antigenic peptide epitopes which show various affinities for human leukocyte antigens (HLA) HLA-DR2 and DR3. Also included is a composition comprising an antigenic peptide and a Major histocompatibility complex (MHC) component having an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide epitopes of the acetylcholine receptor target helper T cells recognize an antigen in association with an MHC component and are useful to treat autoimmune disease particularly myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antigenic binding sife, where binding of the peptide to the binding site induces non-responsiveness in a target T cell in a mammal, where the MHC component is an MHC class II component. Peptides with affinity for HIA-DR2 and DR-3 from proteins other than ACMR are also included. The composition is used to treat myasthenia gravis and other autoimmune
                 This invention describes a novel method for diagnosing haemochromatosis
                               by testing a biological sample for a sequence that represents a 12 musleocide deletion from exon 16 of the cDNA for TFR2 (transferrin receptor-2). The method can detect haemochromatosis before clinical symptoms are manifest (by which time irreversible damage to organs has occurred). This sequence represents a fragment of the human TFR2-alpha (see Genbank NM 003227) which is used in the method described in the disclosure of the invention
                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human Acetylcholine receptor alpha subunit peptide AChR 330-343.
                                                                                                                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                        New Herpesviridae thymidine kinase mutants - useful for treating prostate hypertrophy, allergies, cystic fibrosis and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a mutant form of amino acids 159-173 of the herpes simplex virus type 1 (HSV-1) thymidine kinase (TK) protein which was used to generate mutant TK proteins. The invention relates to the generation of novel HSV-1 TK or guanylate kinase (GK) genes with a mutation upstream, within or downstream from a DRH nucleoside binding site. The TK enzymes can be used for inhibiting pathogenic agents, e.g. tumours, hyperkardosis, psoriasis, prostate hypertrophy, hyperthyroidism, endocrinopathies, autoimmune diseases, allergies, restenosis, viral diseases such as ADS, hepatitis, intracellular parasitic diseases or bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

viral disease; AIDS; hepatitis; parasite; bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Herpesviridae thymidine kinase mutants - useful for treating prostate hypertrophy, allergies, cystic fibrosis and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HSV-1; thymidine kinase; mutation; DRH nucleoside binding site; enzyme; pathogen; tumour; hyperkeratosis; psoriasis; prostate hypertrophy; hyperthyroidism; endocrinopathy; autoimmune disease; allergy; restenosis; viral disease; AIDS; hepatitis; parasite; bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a mutant form of amino acids 159-173 of the herpes simplex virus type 1 (HSV-1) thymidine kinase (TK) protein which was used to generate mutant TK proteins. The invention relates to the generation of novel HSV-1 TK or guanylate kinase (GK) genes with a mutation upstream, within or downstream from a DRH nucleoside binding site. The TK enzymes can be used for inhibiting pathogenic agents, e.g. tumours, hyperkeatosis, profitsis, profitsis, profitse, hyperthyroidism, endocrinopathies, autoimmune diseases, allergies, restenosis, viral diseases such as AIDS, hepatitis, intracellular parasitic diseases or bacterial infection
                                                                      HSV-1; thymidine kinase; mutation; DRH nucleoside binding site; enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .,

                                                                                                                                                                               This sequence represents a mutant form of amino acids 159-173 of the herpes simplex virus type 1 (HSV-1) thymidine kinase (TK) protein which was used to generate mutant TK proteins. The invention relates to the generation of novel HSV-1 TK or guanylate kinase (GK) genes with a mutation upstream, within or downstream from a DRH nucleoside binding site. The TK enzymes can be used for inhibiting pathogenic agents, tumours, hyperkardosis, psoriasis, prostate hypertrophy, hypertratosis, ondocrinopathies, autoimmune diseases, allergies, restenosis, viral diseases such as AIDS, hepatitis, intracellular parasitic diseases or bacterial infection

This sequence represents a mutant form of amino acids 159-173 of the herpes simplex virus type 1 (HSV-1) thymidine kinase (TK) protein which was used to generate mutant TK proteins. The invention relates to the generation of novel HSV-1 TK or quanylate kinase (GK) genes with a mutation uperceam, within or downstream from a DRH nucleoside binding site. The TK enzymes can be used for inhibiting pathogenic agents, e.g. tumours, hyperkeratosis, psoriasis, prostate hypertrophy, e.g. restenosis, viral diseases such as AIDS, hepatitis, intracellular parasitic diseases or bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for diagnosing haemochromatosis by testing a biological sample for a sequence that represents a 12 nuclectide deletion from exon 16 of the CDNA for TFR2 (transferrin receptor-2). The method can detect haemochromatosis before clinical symptoms are manifest (by which time irreversible damage to organs has occurred). This sequence represents a fragment of the human TFR2-alpha (see Genbank NM_003227) which is used in the method described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosis of hemochromatosis, by detecting a specific deletion in the transferrin receptor-2 gene, or corresponding deletion from the encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; TFR2-alpha; diagnosis; haemochromatosis; transferrin receptor-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
develop products for treating e.g. tumours, autoimmune diseases, allergies, restenosis or viral, bacterial or parasitic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

Novel Herpesviridae thymidine kinase mutant useful for inhibiting pathogens e.g. viruses, bacteria, tumor in animals, has one or more mutations encoding amino acid substitutions upstream from the DRH nucleoside binding site.

Disclosure, Col 83-84; 78pp; English.

The invention describes an isolated Herpesviridae thymidine kinase (TK) comprising a 12 amino acid (aa) nucleoside binding region having a site 3 made up of a DRH nucleoside binding site and a site 4 and mutation(s), at least one of the mutations being an as substitution 2 or 3 as upstream or 5 or more as downstream from the DRH motif that increases a biological activity, preferably ability of TK to phosphorylate a nucleoside analogue, as compared to unmutated TK. TK mutants are useful for inhibiting a pathogenic agent such as viruses, bacteria, parasites, tumour cells or autoreactive immune cells in a warm-blooded animal. TK proper expression using gene therapy, e.g. including adenosine deaminase deficiency, and Alzheimer's disease. The mutants are utilised as a conditionally lethal marker for homologous recombination. This is the amino acid sequence of a herpesviridae thymidine kinase (TK) mutant mutant is useful for inhibiting a tumour or cancer in a warm-blooded animal, for treating a variety of disease e.g., hyperkeratosis (psoriasis), prostate hypertrophy, hyperthyroidism, endocrinopathies, autoimmune diseases, allergies, restenosis, viral diseases such as acquired immunodeficiency syndrome (AIDS) hepatitis (HCV or HBV), intracellular parasitic diseases, and to correct aberrant expression of gene within a cell, or to replace a specific gene which is defective in

comprising a 12 amino acid (aa) nucleoside binding region having a site 3 made up of a DRH nucleoside binding site and a site 4 and mutation(s), at least one of the mutations being an aa substitution 2 or 3 aa upstream or 5 or more aa downstream from the DRH motif that increases a biological

activity, preferably ability of TK to phosphorylate a nucleoside analogue, as compared to unmutated TK. TK mutants are useful for inhibiting a pathogenic agent such as viruses, bacteria, parasites, tumour cells or autoreactive immune cells in a warm-blooded animal.

(SENP: see ANII0068-AA128459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                proper expression using gene therapy, e.g. including adenosine deaminase deficiency, and Alzhahimer's diseases. The mutants are utilised as a conditionally lethal marker for homologous recombination. This is the amino acid sequence of a herpesviridae thymidine kinase (TK) mutant
   or to replace a specific gene which is defective in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human single exon nucleic acid probes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.

                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
        Peptide #12604 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; bone marrow expressed exon; gene expression analysis; probe;

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 37810.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhobesis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesteroleamia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence
                                                             probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                     Gaps
                                                    invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 1287 open reading frames derived from the 1261 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the
information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                      Human peptide encoded by genome-derived single exon probe SEQ ID 37011.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary haemosiderosis; pulmonary histiccytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.
                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease;

array, identifying exons in a eukaryotic genome, comprising of the eukaryote; and (b) detecting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably above muclaic acids from enkaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridiation to a single exon microarrays having a probe with the exon, where a common pattern of microarrays having a probe with the exon, where a common pattern of microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the correct of and for identifying exons in a gene; particularly using human ung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary diseases (CDP), interstitial lung diseases (LDD), familial idiopathic pulmonary fibrosis, pulmonary are an expedience is a peptide/protein encoded by a single exon probe of the study. Implantagioleionyomicosis, pulmonary haemosiderosis, pulmonary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ionophore; antimicrobial; antiviral; antibacterial; antiparasitic;

                      The peptide sequence is that of an ion forming peptide used to inhibit the growth of target cells, viruses and virally infected cells in a host, i.e. they are antimicrobial, antiviral, antibacterial, anticiancer and antiparasitic agents or spermicides. They can also be used to stimulate wound healing and can be used to treat burns. The peptides can be used in human or veterinary medicine as preservatives, sterilants or disinfectants and in plant protection. See also AAKS4880-906. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to analogues of a magainin I or II, D-form analogues, deletion analogues or related peptides. It also relates to basic polypeptides having at least 16 amino acids, including at least 8 hydrophobic amino acids and at least 8 hydrophilic amino acids. The peptides may be used as antimicrobial agents, antiviral agents, antibiotics, antitumour agents, antiparasitic agents, spermicides, preservatives or sterilants, or agents for promoting wound healing. The present sequence represents a specific example of a peptide disclosed in the specification

The invention relates to a composite binding polypeptide comprising a first natural binding domain derived from a first natural binding to polypeptide and a second natural binding domain derived from a second natural binding polypeptide, where the first and second natural binding polypeptide, where the first and second natural binding polypeptide. The invention also relates to a chimeric comprising a binding polypeptide cited above and a biological second binding polypeptide. The invention also relates to a chimeric polypeptide comprising a binding polypeptide cited above and a biological category of natural zinc finger nucleic acid binding domains, a library of natural zinc finger nucleic acid binding domains, a library of natural zinc finger nucleic acid binding domains composition of binding to a target site and a method for designing a composite binding colypeptide. The methods and compositions of the present invention are useful for designing sequence-specific binding proteins for regulation of gene expression in the fields of molecular biology. They can also be used for the diagnosis and treatment of autoimmune disorders, and as research
                                                                                                                                                                                                                                                                                                                                                                                                         Composite binding polypeptide, zinc finger nucleic acid binding domain, autoimmune disorder, immunosuppressive, zinc finger DNA binding domain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tools and in transgenic animals. This sequence represents a human zinc finger DNA binding domain used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composite binding zinc finger polypeptide, useful for designing sequence-specific binding proteins regulating gene expression in the fields of molecular biology, and for the diagnosis and treatment of

```
The invention relates to a composite binding polypeptide comprising a first natural binding domain derived from a first natural binding polypeptide and a second natural binding domain derived from a second natural binding polypeptide, where the first and second natural binding polypeptide, where the first and second natural binding polypeptides, where the first and second natural binding polypeptides. The invention also relates to a chimeric second binding polypeptide in a library of natural since a binding polypeptide comprising a binding polypeptide cited above and a biological natural zinc finger nucleic acid binding domains, a library of natural zinc finger nucleic acid binding domains comprising a linker attached to it, a method for selecting a binding polypeptide capable of binding to a target site and a method for designing a composite binding polypeptide. The methods and compositions of the present invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for designing sequence specific binding proteins for regulation of gene expression in the fields of molecular biology. They can also be used for the diagnosis and treatment of autoimmune disorders, and as research
                                                                                                                                                                                                                                                                                                       Composite binding polypeptide; zinc finger nucleic acid binding domain; autoimmune disorder; immunosuppressive; zinc finger DNA binding domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tools and in transgenic animals. This sequence represents a human zinc finger DNA binding domain used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composite binding zinc finger polypeptide, useful for designing sequence-specific binding proteins regulating gene expression in the fields of molecular biology, and for the diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.8%; Score 6; DB 6; Length 23;

The invention relates to novel human secreted proteins. The protein is useful for diagnosing a pathological condition. The protein is useful for diagnosing a pathological condition or protein is useful for diagnosing a pathological condition or a susceptibility to pathological condition in a subject. The protein is useful for identifying a binding partner. The nucleic acid is useful for diagnosing pathological condition or a susceptibility to pathological condition in a subject. The protein is useful as reagents for differential identification of the tissues or cell types present in a biological sample. The protein can be administered to pathological subject or the protein can be administered to pathological condition. In a subject. The protein can be administered to patients having absent or decreased levels of different polypeptides, e.g. haemoglobin S for hemographic e.g. insulin, to supplement absent or decreased levels of different polypeptides e.g. haemoglobin S for membrane bound receptor by competing inhibit the activity of membrane bound receptor by competing receptors used in reducing inflammation, or to bring about a desired response e.g. blood vessel growth inhibition, enhancement of immune response to prodiferative cells or tissues. The protein and the nucleic acid are useful for treating, preventing, detecting, diagnosing discasses. The protein and the nucleic acid are useful for treating diseases, disorders and or creating.

The protein the nucleic acid and antibodies are useful for treating increased in sortions of immune system involving diseases, disorders and or construct and an account and a second increased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immune system, hyperproliferative disorders including neoplasms, cardiovascular disorders (such as peripheral artery disease, limb ischaemia, arterio-arterial fistula, arteriovenous fistula, congenital heart defects, etc), neovascularisation disorders, wound healing and epithelial cell proliferation, neurological diseases (such as Alzheimer's disease, Parkinson's disease, Huntington's disease, mania, dementia, etc), infectious diseases caused by virus, bacteria, fungi, etc. The present sequence represents the amino acid sequence of a novel human secreted protein associated polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunosuppressive, antiinflammatory; anti-HIV; antibacterial; vulnerary; antiparkinsonian; antisickling; antianaemic; antiarthritic; cancer; antipheumatic; hepatotropic; cerebroprotective; antiinflammatory; antipallergic; antidiabetic; antiulcer; anticonvulsant; antifungal; antiparasitic; cardiant; immune disorder; cardiovascular disorder; neurological disease; infection; nephrotropic; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; nootropic; neuroprotective; cytostatic; dermatological; virucide;
                                                                                                      Novel human secreted proteins useful for treating and/or diagnosing disorders of immune system, cardiovascular disorders such as peripheral artery disease, neurological diseases such as Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                The invention relates to novel genes (ABAl1004-ABA21534) and proteins (ABBHA678-ABBA18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The uncleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and owner and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune baset, gastrointestinal tract, liver, lung, or urogenital; (b) immune baset, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, theumatoid arthritis and ulcerative colifis; (c) and amenda, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, theumatoid arthritis and ulcerative colifis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó
Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Suppressor of uncoupling protein 1; SOUP1; membrane stability; obesity; organalle function; mitrochondria; peroxisome; cellular metabolism; ROS; homeostasis; body weight; metabolic disorder; adipositas; cachexia; eating disorder; wasting syndrome; mitochondrial disorder; antilipaemic; pancreatic dysfunction; anorectic; immunomodulator; gene therapy; regulator of transporter molecule; modifier of mitochondrial protein; fruit fly; human; mouse; transmembrane domain

The present invention relates to a new nucleic acid molecule, termed suppressor of uncoupling protein 1 (SOUPI), encoding a polypeptide contributing to membrane stability and/or function of organelles. The invention is useful for monitoring and/or controlling the function of gene and/or gene product which is influenced and/or modified by the SOUPI colypeptide, where the gene and/or gene product is expressed in corganelles such as mitochondria or peroxisome, or for identifying corganelles such as mitochondria or peroxisome, or for identifying a coll interacting with the polypeptide. The invention is also useful for identifying a polypeptide or substance(s) involved in cellular metabolism in an animal or capable of modifying homeostasis, or for identifying a polypeptide involved in the regulation of body weight or verifying a disorder in cells, cell masses, organs and/or subjects, where the disorder is a metabolic for treating, alleviating and/or preventing a disorder in cells, cell masses, organs and/or subjects, where the disorder is a metabolic disorder such as obesity, adipositas, eating disorder; wanting subjects, and disorders related to ROS production. The invention is useful for the detection of polypeptides capable of contributing to membrane stability and/or function in organelles, capable of modifying mitochondrial corders and contributing cellular metabolism. The present contribution of many peptide of the invention and sequence represents a SOUPI transmembrane domain peptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "The side chain carboxyl group of Glu at position 19 forms a lactam bridge with the side chain amino group of Lys at position 22"

```
This 3Ala Astressin is a lipophilic corticotropin-releasing factor (CRF) analogue where some amino acids in the native h/rCRF (Astressin) have been replaced by alanine at positions 20, 25 and 32. The CRF analogue retains the CRF ligand binding activity. CRF is thought to integrate endocrine, autonomic, immune and behavioural responses to stress in the Central nervous system (CNS) through regulation of hypothalamus-pituitary-adrenal axis leading to glucocorticoids release after stress exposure, in which signal transduction is mediated through receptors. Analogues of CRF can intrate or block biological function of CRF (agonists or antagonists respectively), making them useful in investigation of peptidergic systems and as therapeutic agents e.g. in prevention or treatment of stress, depression, anxiety and other psychosomatic diseases. They can be used alone or with other agents and treatments. The analogues can easily pass through the blood-brain barrier due to their high affinity to CRF receptor and raised lipophilicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

o,
                                                                                                                                                                                                                                                                                  The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide #11097 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human borne marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing
             Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       marrow expressed exon; gene expression analysis; probe; cancer; leukaemia; lymphoma; myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human bone marrow expressed probe encoded protein SEQ ID NO: 37258.
